

South Parkers Lake Erosion Repair

The South Parkers Lake Erosion Repair Project was constructed in 2006 to repair and prevent sediment and nutrient deposition into Parkers Lake from a drainage channel on the south side of Parkers Lake. Surface water runoff from as far south as Gleason Lake Road drains to this area and conveys sediments and nutrients which can degrade the water quality of Parkers Lake. Water quality monitoring from 2005 to 2007 indicates a 40% reduction (15 lbs) in nutrient loading from this area annually. The project extends from the intersection of 9th Avenue and Niagara Lane, north to the Luce Line Trail.
